

## Various

Feature	Description
Roadmap	The option 'Show project dependencies' has been changed to a dropdown with 3 choices: Show none, Show all and Show misalignments. With the last option only relations between projects that cannot be met are shown.
Reports	Reports for projects can now be created for multiple selected projects.
User settings	The page 'User settings' has been split in 'User settings', 'User defaults' and 'Rename and delete' (presets and filters). The last one can be found in the Preset-menu.

## Performance improvements

Feature	Description
Filters	The filters have been moved from a 'sliding panel' to a 'popup'-window. It appeared that the sliding panel (which is loaded each time the page is refreshed) had a performance penalty. By moving this to a popup window the filters will only be loaded when needed.
Dropdown input controls	The content of the dropdown input controls will be loaded 'on demand'. This means that the content will only be loaded when needed. Especially with large lists this results in a performance improvement on all data pages.
