

FLIGHTMAP 7.10 Release

FLIGHTMAP 7.10 is the next minor release of FLIGHTMAP. It focuses on new functionalities regarding chart building and reporting as well as many other technical improvements.

Feature	Description
Exploded view in bubble chart	When bubbles are grouped, it is now possible to click on a grouped bubble to see the underlying projects or markets: Flightmap automatically sets a filter to view the underlying projects in the bubble chart.

Figure 1: Bubbles grouped by portfolio (left-chart), click on a bubble results in a view of the projects within the portfolio (right-chart)

Better use of compositions

With the improvement of scenario analysis via compositions over the last releases, more and more analyst are using compositions. Accordingly, the use of compositions has been made easier by a 'Copy' function to copy the composition including the links to the projects. In addition, advanced logic has been implemented to easily read project data accumulated on the composition page. This gives, for example, the ability to create a 'Composition summary' page that automatically inherits the elements of the project summary. Accordingly, an even better comparison between and reporting of compositions becomes possible.

Improved report presets

To standardize a periodic report or quickly create an often-used report, it is now possible in Flightmap 7.10 to create Report presets. This functionality has now been further extended by, among others, also saving the filters

added to a chart. An improved position of the graph on the PowerPoint slide (including the legenda) and multiple user-interface improvements have also been implemented.

Other improvements

- The export of data pages has been improved; the Excel file now contains the exact data of the page, including project-specific labels and formatting.
- Numbers are now right-aligned in tables (both data-entry pages and lists), for more easy reading over rows and columns.
- Improved error messages for upload, Flightmap now gives an overview of the projects and exact values that could not be imported, along with an explanation.
